

GlamNet Build Brief: Team Bookings + Referral & Review System

Read this first, before touching any code. This brief covers two features. Build them as described. Do not redesign existing screens, do not add mock or placeholder data, and do not touch the Client/Artist/Brand app boundaries beyond what's specified here. If something is unclear, stop and ask rather than guessing.

Context (read the real code first)

Before writing anything, pull the actual current code from Replit ("Glamnet Stylist App," account alwandekhoza6). Do not build from this brief alone or from any prior mockup. Confirm the real structure of:

- The current `Booking` model/table
- The current `Artist` model/table
- `constants/data.ts` (categories, roles)
- The booking creation flow in the Client app

Report back what you find before making changes, in case the real structure differs from what's assumed below.

Part 1: Team Bookings

What it does

Right now, one booking = one client + one artist. This feature lets a single booking include multiple artists, each with their own role (hair, makeup, nails, lashes, barber), so a client booking for a wedding or event can get a full team in one transaction.

Data model changes

- Add a `Team` concept that sits between `Booking` and `Artist`.

- A `Booking` can have one or many `TeamMembers` .
- Each `TeamMember` record needs: `artist_id` , `role` (from the existing category list in `constants/data.ts` , do not create a new list), `payout_percentage` (their share of the 82% artist pool for that booking), and `status` (invited, confirmed, declined).
- One artist on the team is flagged `is_lead` (true/false). The lead is the point of contact for the client, but every team member still gets paid individually through PayFast, same as today, just split according to their `payout_percentage` .
- The 82/18 split (82% to artists, 18% to GlamNet) does not change. It's the 82% that gets divided among team members, not the platform's cut.

Flow

1. Client books for an event and selects "Team booking."
2. Client can either pick each artist by role herself, or pick a lead artist who then invites others.
3. Invited artists confirm or decline in their app (this is new for the Artist app, needs a simple accept/decline screen, similar pattern to how booking confirmations already work).
4. Booking only moves to "confirmed" once every team member has accepted.
5. Payment, escrow, and the 24-hour release rule work exactly as they do today, just applied per team member's split.

Guardrails

- Do not change how solo bookings work. Team bookings are an addition, not a replacement.
- Do not build a new payment integration. This still runs through PayFast under the existing merchant account.
- Do not invent new categories. Barber and the existing categories from `constants/data.ts` are the full list unless told otherwise.
- No fake/demo team data. If you need to test the flow, use real test accounts, not seeded fake artists.

Part 2: Referral & Review System

These are two connected but separate features. Build both, keep them as separate modules.

Referral system

- Every artist gets a unique referral code, generated automatically when they join.
- When a new artist or client signs up using that code, and that new person completes their first booking, the referring artist earns a bonus. Keep the bonus amount as a config value (not hardcoded), Alwande will set the actual number later.
- Track referrals in a simple table: `referrer_id`, `referred_id`, `referred_type` (artist or client), `status` (pending, completed), `bonus_paid` (true/false).
- Do not auto-pay the bonus through PayFast yet. Just track it as "owed" and let it show in the artist's earnings screen as pending. Manual payout comes later.

Review & reputation system

- After every completed booking, the client is prompted to rate the artist (or each team member, if it was a team booking).
- Rating structure: a simple 1 to 5 star rating plus an optional short text review. Keep it simple, do not over-engineer with multiple categories of rating.
- Each artist's profile shows an average rating and total completed bookings. This is their reputation score.
- This score is visible to clients and brands browsing artist profiles. It is not editable by the artist.
- No review, no rating shown, don't fake a default score. An artist with zero reviews shows "New artist" or similar, not a 5-star default.

Guardrails

- These are additive features. Do not change the existing booking completion flow beyond adding the rating prompt at the end.
 - No fake reviews, no fake referral data, ever, even for testing or demos.
 - Keep this out of the Brand app for now. Reviews and referrals apply to Client bookings and Artist accounts only, unless told otherwise. Brand campaign flows (job board model) are a separate system, do not merge them.
-

General rules for this build

1. Confirm the real current code structure before changing anything.
2. Keep Client (direct booking) and Brand (job board) logic completely separate. This has caused bugs before, don't repeat it.
3. No fake or placeholder data anywhere, in code, in tests, or in demos.
4. Test locally, then deploy to Vercel, then report back what changed.
5. If anything in this brief conflicts with what you find in the real codebase, stop and flag it rather than picking one and guessing.
